

# Linear Spaces Exercises

1) Let  $S$  be a basis for  $X$  so that for every  $x \in X$ , there exist elements  $x_1, x_2, \dots, x_n \in X$  and scalars  $\alpha_1, \alpha_2, \dots, \alpha_n \in \mathbb{R}$  such that

$$x = \sum_{i=1}^n \alpha_i x_i$$

Prove that  $\alpha_i$  is unique for all  $i$ . (Hint: use Proposition 1). **Solution:** From the definition of basis,  $\text{span}(S) = X$ . Therefore every element of  $X$  can be expressed as a linear combination of elements of  $S$ . We need to show that this representation is unique. For contradiction assume there is an element  $a \in X$  such that

$$a = \sum_{i=1}^n \alpha_i x_i$$

$$a = \sum_{i=1}^n \beta_i x_i$$

where the set of  $\alpha_i$  is not the same as the set of  $\beta_i$ . Subtracting these yields

$$\sum_{i=1}^n (\alpha_i - \beta_i) x_i = 0$$

Because  $\alpha_i \neq \beta_i$  for at least one  $i$ , the equation implies that  $S$  is not linearly independent. This contradicts the fact that  $S$  is a basis. Therefore any element in  $X$  is uniquely represented by a linear combination of the basis elements.

2) Prove or disprove the following statement: any vector space  $X$  has a unique basis. **So-**

**lution:** False. Trivial proof by counterexample.

3) Prove that if  $X$  is an  $n$ -dimensional linear space, then any set  $S \subset X$  of  $n + 1$  elements is linearly dependent. (Hint: use Propositions 1 and 5).

**Solution:** Let  $x_1, x_2, \dots, x_{n+1}$  be any set of elements in  $X$ . Assume that the first  $n$  elements are linearly dependent. From (ii) this implies that there are scalars  $\alpha_i \in \mathbb{R}$  such that not all are zero and

$$\sum_{i=1}^n \alpha_i x_i = 0$$

Therefore

$$\left(\sum_{i=1}^n \alpha_i x_i\right) + 0 \cdot x_{n+1} = 0$$

Therefore  $x_1, \dots, x_{n+1}$  must also be linearly dependent.

Now assume that  $x_1, \dots, x_n$  are linearly independent. We know from (i) that the  $n$  elements form a basis for  $X$ . Therefore  $x_{n+1}$  can be expressed as a linear combination of the  $n$  elements because they span  $X$ . This implies that there exist  $\alpha_i$  such that

$$x_{n+1} = \sum_{i=1}^n \alpha_i x_i$$

Subtracting  $x_{n+1}$  from both sides yields

$$(-1)x_{n+1} + \sum_{i=1}^n \alpha_i x_i = 0$$

By (ii) this implies that  $x_1, \dots, x_{n+1}$  are linearly dependent.
