## Comparative Statics Exercises (Solutions)

- 1) Prove that if f is differentiable, then f has increasing differences if and only if  $\frac{\partial^2 f(x,\theta)}{\partial x \partial \theta} \geq 0$ .
- 2) Consider the parameterized optimization problem

$$\max_{x \in [0,1]} (1-x)p(x) + q(1-p(x))$$

where  $p(\cdot) > 0$  is strictly increasing and concave. Assume that  $x^*$  is on the interior of [0, 1].

- i) Use the implicit function theorem to show how the optimal choice of x given q,  $x^*(q)$  changes as q changes.
  - ii) How does the value function change as q changes?
- 3) Consider the parameterized optimization problem

$$\max_{x,z} \quad f(x,z;\theta)$$

where  $x, y, \theta \in \mathbb{R}$ . Assume f is twice continuously differentiable. Let  $f_{ij}$  denote  $\frac{\partial^2 f}{\partial i \partial j}$  for  $i, j \in \{x, z, \theta\}$  i.e.  $f_{xx}$  is the second derivative of f and  $f_{xz}$  is the cross partial derivative of f with respect to f and f are f and f and f and f and f and f are f and f and f and f are f are f and f are f are f and f are f are f are f and f are f and f are f are f are f and f are f and f are f and f are f are f and f are f are f and f are f and f are f are f and f are f are f and f are f are f are f and f are f

- i) What conditions on  $f_{xx}$ ,  $f_{zz}$ , and  $f_{xz}$  must hold for  $(x^*(\theta), z^*(\theta))$  to be a local maximum? (Hint: what must be true of the Hessian matrix with respect to choice variables at a local maximum?)
  - ii) Use the implicit function theorem to characterize  $\frac{\partial}{\partial \theta}x^*(\theta)$  and  $\frac{\partial}{\partial \theta}z^*(\theta)$  in terms of  $f_{ij}$ .
  - iii) Let  $f_{x\theta} = 0$ ,  $f_{z\theta} < 0$ ,  $f_{xz} > 0$ . Describe the comparative statics. Now let  $f_{xz} < 0$

and describe the comparative statics. Interpret this result.

iv) Show that if f is supermodular, then  $\frac{\partial}{\partial \theta}x^*(\theta) > 0$  and  $\frac{\partial}{\partial \theta}z^*(\theta) > 0$ .
