Inner Product Spaces, Orthogonality, Projection

Exercises

1. Let X and Y be normed linear spaces. Let $\{x_1, ..., x_n\}$ be a basis for X and $\{y_1, ..., y_m\}$ a basis for Y. Prove that if $x_i \perp y_j$ for all $i \in \{1, ..., n\}$, $j \in \{1, ..., m\}$, then X and Y are orthogonal spaces.

Because $\{x_1,...,x_n\}$ is a basis for X, all $x \in X$ can be expressed as linear combinations of $\{x_1,...,x_n\}$ and similarly for $y \in Y$. Formally, we have

$$oldsymbol{x} = \sum_i lpha_i oldsymbol{x}_i$$

for all $x \in X$ and arbitary α and

$$oldsymbol{y} = \sum_j eta_j oldsymbol{y}_j$$

for all $y \in Y$ and arbitary β . We need to show

$$\langle \sum_{i} \alpha_{i} \boldsymbol{x}_{i}, \sum_{j} \beta_{j} \boldsymbol{y}_{j} \rangle = 0$$

By the bilinearity of the inner product, we have

$$\langle \sum_{i} \alpha_{i} \boldsymbol{x}_{i}, \sum_{j} \beta_{j} \boldsymbol{y}_{j} \rangle = \sum_{i} \langle \alpha_{i} \boldsymbol{x}_{i}, \sum_{j} \beta_{j} \boldsymbol{y}_{j} \rangle$$
$$= \sum_{i} \sum_{j} \langle \alpha_{i} \boldsymbol{x}_{i}, \beta_{j} \boldsymbol{y}_{j} \rangle$$
$$= \sum_{i} \sum_{j} \alpha_{i} \beta_{j} \underbrace{\langle \boldsymbol{x}_{i}, \boldsymbol{y}_{j} \rangle}_{=0}$$

2. Prove: If a vector $\boldsymbol{\alpha}$ is in the null space of a set of vectors $\{\boldsymbol{x}_1,...,\boldsymbol{x}_n\}$, then it is orthogonal to the space spanned by $\{\boldsymbol{y}_1,...,\boldsymbol{y}_m\}$ where

$$y_i = \{x_{1i}, ..., x_{ni}\}$$

Let

$$X = \begin{bmatrix} x_1 & \cdots & x_n \end{bmatrix}$$

store the \boldsymbol{x} vectors. If $\boldsymbol{\alpha} \in N(X)$, then

$$X\alpha = 0$$

or

$$\alpha^T X^T = \mathbf{0}$$

Now let

$$X^T = egin{bmatrix} oldsymbol{y}_1 & \cdots & oldsymbol{y}_m \end{bmatrix} = egin{bmatrix} oldsymbol{x}_1 \ dots \ oldsymbol{x}_n \end{bmatrix}$$

We can represent the space spanned by these vectors with $X^T \beta$ with β taking arbitrary linear combinations of the columns of X^T . We want to show

$$\boldsymbol{\alpha}^T X^T \boldsymbol{\beta} = \mathbf{0}$$

Because $\alpha^T X^T = \mathbf{0}$, this must be the case. \blacksquare .

3. Donald Trump tweeted 100 times in April, 150 times in May, and 110 times in June. Let $\boldsymbol{b} = (100, 150, 110)$ represent the number of tweets in each month. Project \boldsymbol{b} onto the linear space spanned by $\boldsymbol{a} = (1, 1, 1)$. Interpret your result.

We have $p = \hat{x}a$ and e = b - p. We need e to be orthogonal to a, or

$$\mathbf{a}^{T} (\mathbf{b} - \hat{x}\mathbf{a}) = 0$$

$$\mathbf{a}^{T} \mathbf{b} - \hat{x}\mathbf{a}^{T} \mathbf{a} = 0$$

$$\mathbf{a}^{T} \mathbf{b} = \hat{x}\mathbf{a}^{T} \mathbf{a}$$

$$\frac{\mathbf{a}^{T} \mathbf{b}}{\mathbf{a}^{T} \mathbf{a}} = \hat{x}$$

Substituting our values, this becomes

$$\frac{\sum_{i} b_i}{\sum_{i} 1} = \frac{100 + 150 + 110}{3} = 120$$

Notice that for n months of tweeting, this is

$$\frac{1}{n}\sum_{i}b_{i}$$

or simply the mean number of tweets.
